

CUSTOMER SUCCESS STORY

Implementation of Energy Management System University of Central Oklahoma, Edmond, Oklahoma

OVERVIEW:

The University of Central Oklahoma ("Central") was founded in 1890 as one of the state's first institutions of higher learning.

Central's appealing 210-acre main campus offers a learning and living environment that is a source of pride for the Central community. Central is ranked among the top public regional universities in the nation by US News and World Report, and has been named as one of the top universities

SCOPE:

In support of Central's green practices, Summa Energy Solutions was asked to design and implement a campus-wide energy management system. The design specs for this system included the ability to perform measurement and verification (M&V) of newly implemented energy conservation measures and to perform building by building utility sub-billing, allowing Central to allocate utility costs and cost savings to the various departments across campus.

Summa Energy designed an energy management platform for power and natural gas consumption. Meters installed in over 40 buildings across the campus were to push data to a centralized system with an easy to use and easy to understand display format (dashboard). With only two main utility feeds, Central was completely unable to verify energy consumption data with any meaningful granularity. Two reports, one from each feed, were the best they could do, and those

PROJECT SCOPE:

**Power & Gas Metering
In over 40 locations**

PROJECT COST:

Approx. \$225,000.

FEATURES:

**Utility Sub-Billing by
Department with Energy
Measurement & Verification**

SOLUTION:

Summa began by performing an onsite audit of the current metering infrastructure. After identifying appropriate metering locations and creating an inventory of what was already in place, Summa created stamped construction drawings for a complete energy management system. After the installation of the metering hardware was completed, Summa programmed and commissioned the metering infrastructure to guarantee data integrity. Summa then implemented the VITALITY energy management platform for the ability to display an integrated picture of the energy data being collected. With the Summa Vitality system, Central now has over 40 M&V points with the ability to add as many more as they might ever deem necessary. Central also uses VITALITY to do utility sub-billing for all appropriate university departments.
